Abstract of JP 10260844 (A)

PROBLEM TO BE SOLVED: To provide an information communication system that, processes when an information terminal equipment, which does not have a program after version up, acquires such information from an information providing server that can not be processed without the program after version up, makes such information processable. **SOLUTION:** When this information terminal equipment 30 outputs an acquisition request of information 11a stored in a storing means 11 of an information providing server 10 through a communication network 20, an information requesting means 33 adds version information of a program 32 that processes the information to an information acquisition request. The server 10 receives it, and when a version confirming means 12 decides that the program 32 can not process the requested information, an information outputting means 13 sends an adaptive program 11b which processes the requested information. A replacing means 34 of the terminal 30 replaces the program 32 with the adaptive program 11b.
